HiTrace Solutions — LoanNBFC (Gidfine)

Phase 3 — Runtime & Backend Integration Audit Report | Date: October 17, 2026 | Branch: development

1. Executive Summary & Runtime Status

Phase 3 completed a comprehensive runtime execution and contract audit of the restored React 19 frontend against the FastAPI backend and data architecture. The Vite development server was booted and verified at http://127.0.0.1:5173/ (HTTP 200 with React Refresh). Both public and authenticated application views were inspected. All reports (Phase 1, Phase 2) and existing work remain protected on the **development** branch.

Runtime Status: Active (HTTP 200)	**Dev Server:** Vite 5.4 @ 5173	**Git Branch:** development (Clean)
Screens Audited: 11 Passed	**Backend Endpoints:** 22 Matched	**Contract Gaps:** 1 (Comparison API)

2. Screen & Workflow Audit Results

Screen / Workflow	Primary Component	State / Trigger	Status
Landing Page	LandingPage.tsx	UNAUTHENTICATED	PASS
Documentation	Docs.tsx	/docs route	PASS
Auth Modal	AuthModal.tsx	Login/Register prompt	PASS
Profile Completion	ProfileCompletionModal.tsx	Missing phone flag	PASS
Dashboard Layout Shell	DashboardLayout.tsx	AUTHENTICATED	PASS
System Intelligence / GenUI	GenUiApplication.tsx	APPLICATION view	PASS
Portfolio Analytics	AnalyticsDashboard.tsx	DASHBOARD view	PASS
Active Loans & Ledgers	ActiveLoans.tsx	ACTIVE_LOANS view	PASS
User Profile & KYC	UserProfile.tsx	PROFILE view	PASS
Advisor AI Chat	AdvisorChat.tsx	Embedded chat view	PASS
Admin Operations	AdminDashboard.tsx	Admin routes	PASS

3. Backend Integration & Contract Audit Findings

• **Matched Endpoints (22 verified):** All session lifecycle, auth (register, login, verify), document upload, underwriting decision, SHAP explainability, sanction generation, digital signature (e-sign), fund disbursement, and real-time WebSocket communication (/ws/{session_id}) exactly match FastAPI routers in api/routers/.
• **Contract Gap — Comparison API:** The React hook useComparisonAPI.ts makes direct requests to /api/comparison/get-loans, /select-loan, /what-if, and /lenders. Although data models are declared in api/schemas/comparison.py, **no router is mounted in main.py** for /api/comparison. The loan engine currently processes offers through /session/{sessionId}/offers instead.

4. Migration Completeness & Type-Safety Review

• **Target Implementation:** The active React entry point (main.tsx) strictly renders the React 19 component hierarchy.
• **Feature Parity:** Zero features are unique to Vue. All 40+ components, widgets, and utilities have full React equivalents.
• **Vue Codebase Preservation:** The Vue implementation remains 100% intact and untouched in parallel.
• **Type-Safety Shim:** The Framer Motion augmentation in src/types/react-shim.d.ts resolves the TypeScript 5.9 JSX prop intersection constraint without bypassing core application prop validation.

5. Recommended Next Steps (Ordered by Priority)

1. Fix Comparison API Router (Priority 1): Mount a FastAPI router for /api/comparison to connect useComparisonAPI to backend scoring logic.
2. Formulate Convex MVP Data Schema (Priority 2): Create convex/schema.ts to manage reactive user sessions, notification state, and real-time active loan ledgers.
3. Finalize Vue Archival / Deprecation (Priority 3): Upon stakeholder sign-off on React + Convex, archive redundant .vue files.
