GIDFINE — CONVEX CLOUD READINESS REPORT

Reference: Gidfine_Dev_Guide.md (v1.1) | **Active Branch:** development | **Commit:** afb4323 | **Date:** October 20, 2026

Executive Summary: Pre-deployment audit verifying the repository readiness for linking its first real Convex Cloud project. Validates local configuration, confirms unprovisioned deployment state, identifies authentication prerequisites and Dev Guide v1.1 schema gaps, and outlines the exact non-destructive linking sequence without modifying main or deleting Python/FastAPI files.

1. Current Convex Configuration Status

Component	Repository Location	Current State & Readiness
Package & CLI	frontend/package.json	convex@1.47.0 installed; convex:dev, convex:codegen configured
TS Backend Config	frontend/convex/tsconfig.json	Isolated backend compiler options; passes with 0 errors
Foundational Schema	frontend/convex/schema.ts	agencies, users, and auditLogs defined & indexed
Auth Config	frontend/convex/auth.config.ts	Configured for CONVEX_AUTH_ISSUER_DOMAIN with fallback
Server Auth Helper	frontend/convex/lib/auth.ts	Token-level getUserIdentity() verification & role enforcement
Health Query	frontend/convex/health.ts	Reactive health check probe returning status, timestamp, and version
React Provider	frontend/src/lib/convex.tsx	Graceful unprovisioned fallback ensuring React UI never crashes

2. Deployment Status: Is Convex Cloud Linked?

Probing Vector	Observed Finding	Deployment Status
Environment Keys	No CONVEX_DEPLOYMENT or VITE_CONVEX_URL in environment	**UNPROVISIONED**
Local Config Files	No frontend/.env.local or root .env.local exists	**ZERO SECRETS LEAKED**
Convex Metadata	No .convex/ directory found locally or in user profile	**NOT LINKED**
Runtime Posture	Frontend executes cleanly on mock fallback provider without network calls	**SAFE / STABLE**

3. Authentication Prerequisites & Schema Gaps (Dev Guide v1.1)

Auth Decision Required: Team sign-off on OIDC provider (Clerk vs. Auth0), issuer domain configuration in Convex dashboard environment variables, and role provisioning workflow (webhook sync vs. admin pre-invitation).

Domain / Feature	Dev Guide Requirement (Sec 11)	Current Schema Status
Origination	applications, application_documents, borrower_profiles	**Pending Policy Approval**
Pricing & Matching	lender_proposals, proposal_versions, interest_pricing_policies	**Pending Math Standard**
Offer & Consent	borrower_offers, consents	**Pending Contract Template**
Servicing & Ledger	loans, disbursements, repayment_schedules, ledger_entries	**Pending Rounding Policy**
Privacy Redaction	disclosure_policies (field-level masking under Act 843)	**Pending Legal Matrix**

4. Safe Project Linking Steps & Team Blockers

- **Step 1 — Cloud Provisioning:** Run cd frontend && npx convex dev to authenticate and link the official project.
- **Step 2 — Gitignore Verification:** Confirm .env.local is created and remains strictly gitignored.
- **Step 3 — Type Synchronization:** Run npx convex codegen to regenerate live TypeScript definitions.
- **Step 4 — Build Verification:** Run npx tsc --project convex/tsconfig.json and npm run build.

Decisions Requiring Team Approval:

- **1. Tenancy Model:** SaaS multi-tenant isolation (agencyId on every table/query) vs. single-agency internal deployment.
- **2. Identity Provider:** Clerk vs. Auth0 sign-off and issuer domain configuration.
- **3. Financial Calculation Standard:** Flat-rate simple interest vs. reducing-balance amortizing in integer pesewas.
- **4. Act 843 Disclosure Matrix:** Exact field-masking boundary for lender proposal screens.
