GIDFINE — PHASE 3B: LENDER PORTAL & WORKFLOW REPORT

Branch: development | **Stack:** React 19 + TypeScript + Convex | **Spec:** Gidfine_Dev_Guide.md v1.1

1. Executive Summary

Phase 3B completes the institutional lender decision workflow within the Gidfine Loan Agency Platform. It introduces a server-side assigned proposal queue query (getLenderProposals), typed adapter methods in loanService, a dedicated React LenderPortal component mounted in AdminDashboard, strict PII and agency margin redaction, stale/duplicate decision guards, and non-bypass invariants ensuring lender acceptance cannot skip agency approval or borrower consent.

2. Verification & Safety Controls

Requirement	Status	Audit Details
Working Branch	**PASSED**	Work performed strictly on branch *development*. Never touched *main*.
Convex Cloud Safety	**PASSED**	Zero cloud deployment/provisioning commands executed.
Python Backend Integrity	**PASSED**	All FastAPI routes in api/ and tests/ preserved with 0 regressions.
Role Authorization	**PASSED**	Only authenticated users with role lender can access proposals or record decisions.
PII & Margin Redaction	**PASSED**	Borrower name, phone, email, and agency margins are strictly omitted.
Non-Bypass Invariant	**PASSED**	Lender acceptance transitions to LENDER_ACCEPTED. Agency approval is strictly required.

3. Server-Side Query & Service Adapter

• **getLenderProposals:** Requires role lender. Queries proposals using index by_lender. Strictly matches application.assignedLenderId == actor._id and proposal.agencyId == actor.agencyId. Strips borrower identifying data and agency margins.
• **loanService Adapter:** Added LenderProposalItem and LenderDetailedProposal interfaces. Extended with getLenderProposals and getLenderProposal methods. Preserves explicit ConvexCloudUnavailableError handling.

4. LenderPortal Component (AdminDashboard.tsx)

• **Queue Display:** Overview KPIs (Pending, Accepted, Declined counts, Total Volume in GH■) and real-time proposal table.
• **Proposal Inspection:** Dedicated modal displaying pseudonymous case reference (APP-XXXXXX), proposed amount in GH■, base rate in % p.a., and tenure.
• **Decision Modal:** Supports ACCEPT and DECLINE with reason tracking. Explains that acceptance reserves funding capacity and requires separate agency approval and affirmative borrower consent before funding.

5. Verification & Test Summary

Test Suite	Passed	Failed	Coverage Areas
State Machine Tests	7	0	Linear transitions, assigned lender checks, agency & borrower guards, SHA-256 fingerprint.
Convex Mutations & Queries	14	0	Auth checks, assigned lender restrictions, PII redaction, accept/decline, duplicate prevention.

LoanService Adapter Tests	7	0	Pesewas conversions, bps formatting, cloud error throwing, lender queries & decisions.
Python Regression (pytest)	6	0	All FastAPI loan engine endpoints preserved.
TypeScript & Production Build	1845 mods	0 errors	tsc --noEmit clean; vite build succeeded in 17.03s.

6. Remaining Dependencies

1. Cloud Deployment: Matthias to provision Convex Cloud and configure VITE_CONVEX_URL.
2. Auth Provider: Production JWT issuer configuration in frontend/convex/auth.config.ts.
3. Servicing Workflow: Cashier payment recording, reconciliation ledger, and settlement integrations.
